

AssetWhere™ Case Study: Fraser Coast Anglican College

Fraser Coast Anglican College consists of 714 students. OMNILINK worked closely with the school management and found issues with their property management knowledge. In short most plans were not in a central in location, and this affected new staff and contractors as they had to rely on various individuals for what was considered standard information on important infrastructure and property. The College could see the problem becoming more serious, especially as the quality of the plans diminished and as key staff moved on. There was consideration of engaging an architect to redraw all of the plans but as the cost of this was deemed too expensive and again not a viable a long term solution, the College decided to work with OMNILINK after hearing from other schools.

AssetWhere™ has addressed these issues and is regarded as a positive implementation for Fraser Coast Anglican College. The initial phase conducted by OMNILINK to investigate the availability of plans highlighted that the College's nominated architect was not a secure and reliable source of CAD files. OMNILINK resolved this by collated plans for the school buildings from a combination of paper drawings and CAD plans.

Since the implementation of AssetWhere™, considerable time and effort has been saved as the school has seen the benefits of extracting data from the system. AssetWhere™ has provided assistance to Fraser Coast Anglican College in locating room dimensions for an air-conditioning assets review and also extracting information for BGA grant applications.
