

AssetWhere™ Case Study: Salesian College (VIC)

Salesian College (Melbourne, VIC) has 950 students across 2 campuses. OMNILINK were engaged by the College to work with the property management team to improve their property information management procedures. School property records were deemed to be an important corporate resource. A short study found that their maps and drawings were not centralised, and were mostly held by contractors and third parties. Only the property manager could recall valuable knowledge of underground services from memory. This was an on-going problem mostly affecting the staff of the school and had seriously disrupted Salesian College when the property staff had left the school in the past.

These issues were resolved by implementing AssetWhere™. Now the College can capture information when changes are made and all staff have access to the most up-to-date plans and information. The introduction of AssetWhere has been particularly useful during recent redevelopment — contractors have commented on the time they have saved due to the availability of accurate information and the increased communication between contractors on a single reliable source of knowledge. AssetWhere™ was selected following an introduction received at a CEBA conference.

Overall AssetWhere™ has assisted the new Facilities Manager at Salesian College through the ease in providing maps and data on areas around the school campuses. They have said “AssetWhere is a great tool that will continue to develop and store information on the site, giving more control over their sites history and information, and taking the information from contractors and making it their own”.
